Boolean Logic

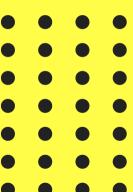

MAKING DECISIONS WITH JAVASCRIPT

COMPARISONS

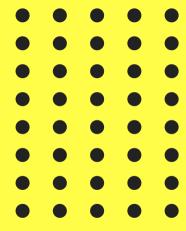

•••

- > // greater than
- < // less than
- >= // greater than or equal to
- <= // less than or equal to
- == // equality
- != // not equal
- === // strict equality
- !== // strict non-equality

SOME EXAMPLES

•••

10 > 1; //true 0.2 > 0.3; //false -10 < 0; //true 50.5 < 5; //false 0.5 <= 0.5; //true 99 >= 4; //true 99 >= 99; //true 'a' < 'b'; //true 'A' > 'a'; //false

0.2 > 0.3; //false Notice these all return a Boolean!

Though it's uncommon, you can compare strings. Just be careful, things get dicey when dealing with case, special characters, and accents!

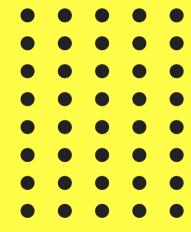

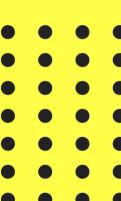

— (double equals)

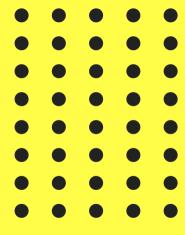

- Checks for equality of value, but not equality of type.
- It coerces both values to the same type and then compares them.
- This can lead to some unexpected results!

== WEIRDNESSS

TRIPLE EQUALS

•••

5 === 5; //true
1 === 2; //false
2 === '2'; //false
false === 0; //false

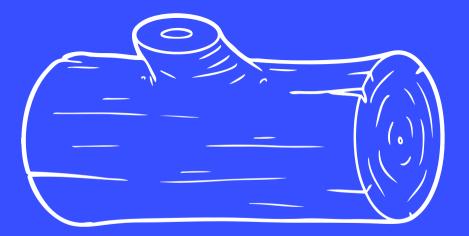

//Same applies for != and !==
10 != '10'; //false
10 !== '10'; //true

CHECKS FOR EQUALITY OF VALUE AND TYPE

CONSOLE. LOG() prints arguments to the console

(we need this if we're going to start working with files!)

Running Code From a File

app.js

•••

//Put your code in the JS File
alert('Hello from JS!');

//Won't show up!!
"hi".toUpperCase();

//Will show up!
console.log("hi".toUpperCase());

Write your code in a .js file

demo.html

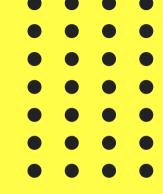

•••

<!DOCTYPE html> <html> <head> <title>JS Demo</title> <script src="app.js"></script> </head> <body> </body>

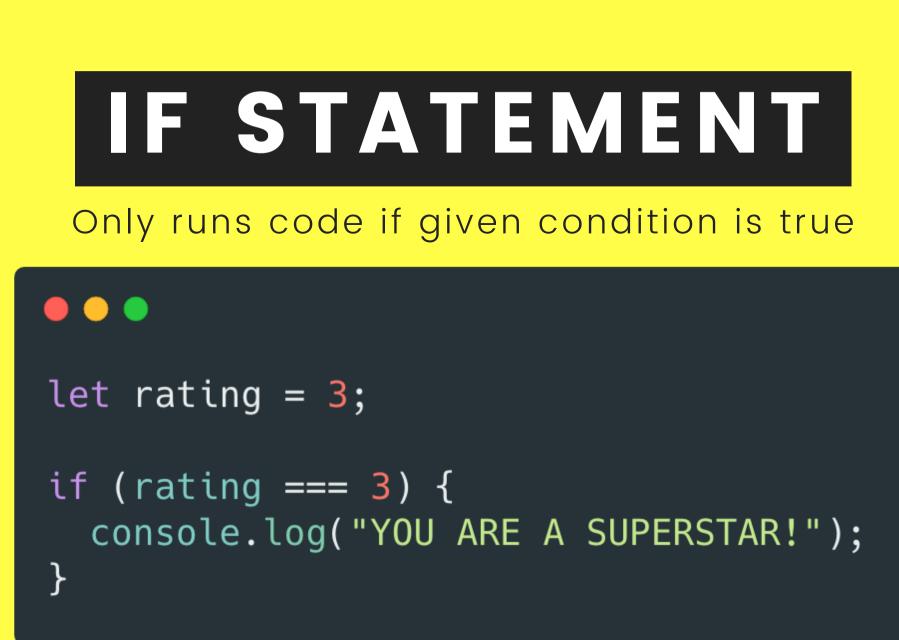

Include your script in a .html file

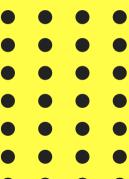

Conditionals

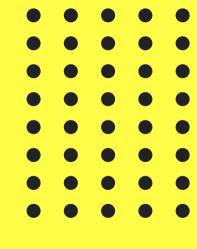

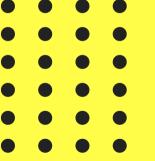

let rating = 2;

```
if (rating === 3) {
   console.log("YOU ARE A SUPERSTAR!");
}
else if (rating === 2) {
   console.log("MEETS EXPECTATIONS");
}
```

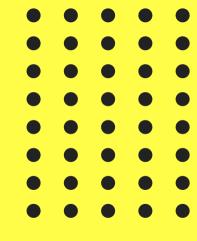

ELSE IF

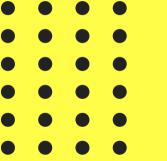

We can add multiple else ifs!

•••

```
let rating = 1;
```

```
if (rating === 3) {
   console.log("YOU ARE A SUPERSTAR!");
}
else if (rating === 2) {
   console.log("MEETS EXPECTATIONS");
}
else if (rating === 1) {
   console.log("NEEDS IMPROVEMENT");
```

ELSE

If nothing else was true, do this...

•••

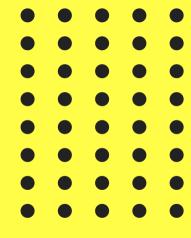

}

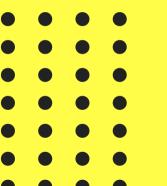

```
let rating = -99;
```

```
if (rating === 3) {
   console.log("YOU ARE A SUPERSTAR!");
}
else if (rating === 2) {
   console.log("MEETS EXPECTATIONS");
}
```

```
else if (rating === 1) {
   console.log("NEEDS IMPROVEMENT");
}
else {
```

```
console.log("INVALID RATING!");
```

NESTING

We can nest conditionals inside conditionals

•••

```
let password = "cat dog";
if (password.length >= 6) {
    if (password.indexOf(' ') !== -1) {
        console.log("Password cannot include spaces");
    }
    else {
        console.log("Valid password!!")
    }
}
else {
    console.log("Valid password!!")
}
```

TRUTHY AND FALSY VALUES

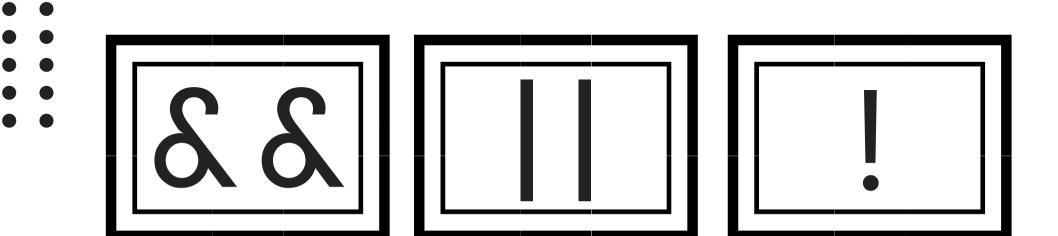

- All JS values have an inherent truthyness or falsyness about them
- Falsy values:
 - false
 - 0
 - "" (empty string)
 - o null
 - undefined
 - NaN
- Everything else is truthy!

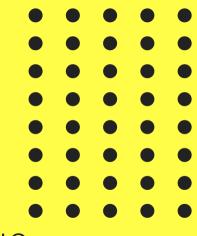

Logical Operators

COMBINING EXPRESSIONS

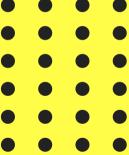

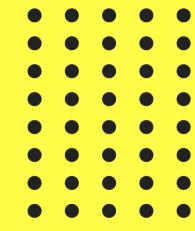

Both sides must be true, for the entire thing to be true

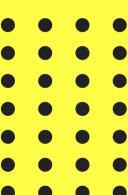

1 <= 4 && 'a' === 'a'; //true
9 > 10 && 9 >= 9; //false
'abc'.length === 3 && 1+1 === 4; //false

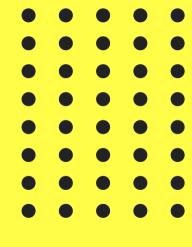

AND

Both sides must be true, for the entire thing to be true

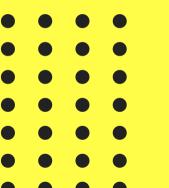

If one side is true, the entire thing is true

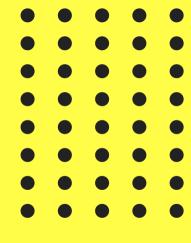

•••

//only one side needs to be true!

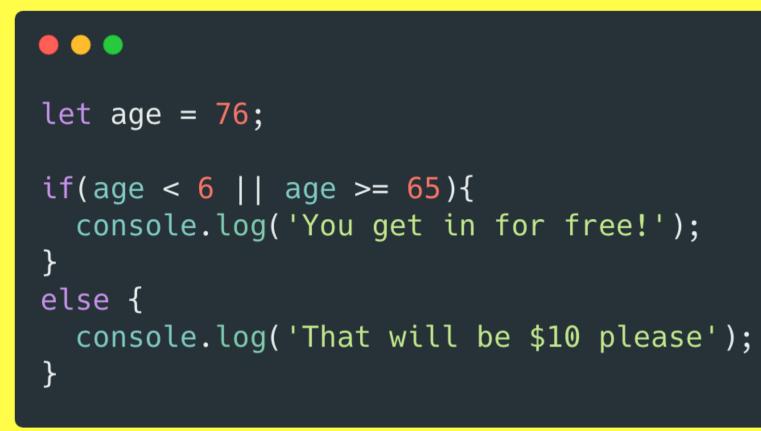

- 1 !== 1 || 10 === 10 //true
- 10/2 === 5 || null //true
- 0 || undefined //false

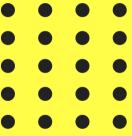

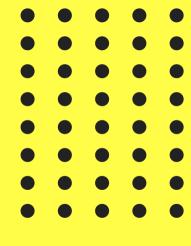

If one side is true, the entire thing is true

!expression returns true if expression is false
